US-09-742-201-1

Sequence 1, Application US/09742201

Patent No. US20020123091A1

GENERAL INFORMATION:

APPLICANT: Gurney, Austin L.

APPLICANT: Kirchhofer, Daniel K.

APPLICANT: Kirchhofer, Daniel K.

APPLICANT: Wood, William I.

TITLE OF INVENTION: No. US20020123091A1el Inhi

TITLE OF INVENTION: for Use in Modulation of

FILE REFERENCE: P1861R1US

CURRENT APPLICATION NUMBER: US/09/742,201

CURRENT FILING DATE: 2000-12-19

PRIOR APPLICATION NUMBER: PCT/US00/06884

PRIOR FILING DATE: 2000-03-15

PRIOR APPLICATION NUMBER: US 60/253,665

PRIOR PILING DATE: 2000-11-28

NUMBER OF SEQ ID NOS: 6
                                                                                                                                                                                                                                                                                                                                                                             1505
                                                                                                                                                                                                                                                                                                                                                                                              1505

This DNA encodes a human secreted protein. The specification provides secreted protein sequences (AAM63681 to AAW63699) encoded by the nucleic acid sequences shown in AAV43601 to AAV43619. The invention provides a

useful as mult: New PRO polypeptides, nucleic acids and (ant) agonists, diagnosing and treating immune-related disorders, such sclerosis, rheumatoid arthritis and diabetes.

21; Fig 11; 127pp; English. Claim

The present sequence is that of cDNA clone DNA35880-1160 (ATCC 209379)
encoding novel human immunomodulator protein PRO256 (UNQ223) (see
AAB20113). The clone was isolated from a human placenta off with library. The
condition for the clone was isolated from a human placenta off with the clone was isolated from a human placenta off with the clone was isolated from a human placentary. The
polynoucleotides (see AAF3050-62) encoding novel human PRO proteins (see
polynoucleotides (see AAF3050-62) encoding novel human PRO proteins (see
polynoucleotides (see AAF3050-62) encoding novel human PRO proteins of inflammatory calls into a tissue of a mammal, stimulating or enhancing an
immune response in a mammal, or increasing infiltration of inflammatory calls into a tissue of a mammal, stimulating or enhancing of inflammatory calls into a tissue of a mammal, stimulating no fructions of the PRO polypeptide or its antagonist have the opposite comprising the PRO polypeptide, an agonist a real disorder, involves administering the PRO polypeptide, an agonist a rell disorder, involves administering an immune related disorder, systemic lupus erythematosus, rheumatory systemic selected from a natisagonist antibody. The disorder is systemic arthritis, spondyloarthropathy, systemic sclerosis, juvenile chronic arthritis, spondyloarthropathy, systemic sclerosis, uttoimmune haemolytic anaemia, autoimmune thrombocytopaenia, thyroiditis, diabetes mellitus, immune-mediated renal diseases (such as multiple sclerosis), autoimmune chromic active hepatitis, primary biliary cirrhosis, granulomatous skin disease, (auto)immune-mediated skin diseases (such as multiple sclerosis), alternsess, (auto)immune-mediated skin diseases (such as such as arakt-versushost colitis and crohn's disease), gluten-sensitive enteropathy, Mipple's asthma, altergic rhinitis, atopic dermatitis, food hypersensitivity and associated diseases (such as graft rejection and graft-versushost colities and colones asthma, altergic chaines as graft rejection and graft-versushos 1ymphocytes disorders Also claimed cells, associated diseases (such as graft rejection and graft-versus-disease) (all claimed). Claimed methods of diagnosing these disease) (all claimed). Claimed methods of the PRO gene. All are a method of identifying a compound capable of inhibiting the expression or activity of the PRO polypeptide, vectors, host chantibodies and a method of stimulating the proliferation of T-

The present invention relates to PRO256 or its agonist/antagonist may be used to treat a cardiovascular, endothelial, or angiogenic disorder in a mammal, especially a human with cardiac hypertrophy, trauma, a type of tumour or age-related macular degeneration. PRO256 may be administered tumour or age-related macular degeneration, or angiogenic agent, a chemotherapeutic agent, a growth inhibitory agent, or a cytotoxic agent. PRO256 may also be used to treat the disorders above, preferably through administration via ex vivo gene therapy. PRO256 or its agonist may be aministration via ex vivo gene therapy. PRO256 or its agonist may be activity of a hepatocyte growth, angiogenesis or protease activity of a hepatocyte growth factor. Stimulation or inhibition of the protease activity of a hepatocyte growth factor is protease activity of a hepatocyte growth factor is protease activity of a hepatocyte growth factor is or angiogenic disorder selected from peripheral vascular disease, hepatic or renal injury or a restinosis disorder. The present sequence is human the procyte growth factor inhibitor, PRO256 cDNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1174
                                                                                                                                                                                                                                                                                                                            The present invention relates to the isolation of novel human PRO polypeptides and the polynucleotide sequences encoding them. The PRO polypeptides, agonists, antagonists or anti-PRO antibodies are useful for treating benign or malignant tumours (e.g. renal, kidney, bladder, breast, etc), leukaemias and lymphoid malignancies, other disorders such as neuronal, glial, astrocytal, hypothalamic, glandular, macrophagal, stromal and blastocoelic disorders, inflammatory, immune and anglogenic disorders. The polynucleotide sequences are also useful in gene therapy. ABK40254-ABK40288 encode for the human PRO polypeptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 128
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   188

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               123
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 308
                                                                                                                                                                                                                                                                                                                                                                          ABL88072 to ABL88258 encode the PRO proteins given in ABB84817 to ABB855003. The PRO proteins and polynucleotides have cardiant, cytostatic antiangiogenic, hypotensive, vulnerary and antiarteriosclerotic activities, and can be used in gene therapy. The PRO polynucleotides, proteins, agonists and antagonists are useful for treating or diagnosing a cardiovascular, endothelial or angiogenic disorder in a mammal, e.g. cardiac hypertrophy, trauma, cancer, age-related macular degeneration, atherosclerosis, hypertension, arterial restenosis, rheumatoid arthritic angina, myocardial infarctions, thrombophlebitis, lymphangitis, tumour angiogenesis (such as breast carcinoma and liver carcinoma) and wound healing. The PRO polynucleotides have applications in molecular biology, including use as hybridisation probes, and in chromosome and gene mapping. ABL88259 to ABL88267 represent primers and probes used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CAAGAAC

New PRO polypeptides and polynucleotides encoding the polypeptuseful in gene therapy, chromosome identification, tissue type genetic analysis of individuals with genetic disorders.

2; Fig 9; 218pp; English Claim

This invention relates to the cDNA and protein sequences of novel
secreted and transmembrane polypeptides PRO polypeptides. The invention
also comprises a method for producing the proteins of the invention by
recombinant means and antibodies specific for the protein of the
invention. The antibody may be used for detecting the PRO proteins of the
invention and may be used to modify their activity. polynucleotides may
be used as hybridisation probes for a cDNA library to isolate the fulllength PRO cDNA or to isolate other cDNAs, to construct hybridisation
probes for mapping the gene which encodes that PRO and for genetic
analysis of individuals with genetic disorders, in assays to identify
other proteins or molecules involved in binding reaction, to generate
transgenic animals or knock-out animals which in turn are useful in the
development and screening of therapeutically useful reagents, for
chromosome identification, and tissue typing. The PRO polypeptides are
useful in gene therapy, and as molecular weight markers for protein
clectrophoresis purposes. The sequences may also be used to detect
overexpression on PRO polypeptides in cancerous tumours and for screening

          of human
The present invention provides the protein and coding sequences of human PRO proteins. These are useful for treating or diagnosing a cardiovascular, endothelial or angiogenic disorder, including cardiac hypertrophy, trauma, cancer, age-related macular degeneration, atherosclerosis, hypertension, arterial restenosis, rheumatoid arthritiangina, myocardial infarctions, thrombophlebitis, lymphangitis, tumour angiogenesis (such as breast carcinoma and liver carcinoma) and wound healing. The present sequence is a coding sequence of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

```
factor-alpha (TNF-alpha) from human blood, a method for stimulating the proliferation or differentiation of chondrocyte cells and a method for detecting the presence of a tumour in a mammal (e.g. adrenal, lung, colon, breast, prostate, rectal, cervical and liver tumours). The polynucleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and DNA and in gene therapy. The polynucleotides may also be used in preparing PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of therapeutically useful reagents. The PRO polypeptides or antibodies are used in preparing a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of human microvascular endothelial cells, for inducing endothelial cell tube formation and for treating sports-related joint problems, articular cartilage defects, osteoarthritis and rheumatoid arthritis. This sequence represents a human PRO polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1354

The invention relates to an isolated secreted/transmembrane (PRO)

polypeptide, having at least 80% sequence identity to a sequence selected from any one of the 57 amino acid sequences given in specification, or to a sequence encoded by a nucleic acid molecule selected from any one of the nucleic acids deposited under any of the ATCC accession numbers given in specification, or a sequence having at least 80% identity to PRO lacking its associated signal peptide, an extracellular domain of PRO acking its associated signal peptide, Also included are vectors, transformed host cells, anti-PRO antibodies, the nucleic acids encoding PRO, PRO Eusion proteins, inducing endothelial cell tube formation (by administering PRO2107, PRO21801, PRO1560, PRO1860, PRO499), PRO4091, PRO4091, PRO21093 can oligonucleotide probe derived from any one of the above nucleotide sequences. PRO6108 polypeptide is useful for stimulating the proliferation of numan microvascular endothelial cells. PRO6071, PRO4897 and PRO6006 polypeptides are useful for stimulating the proliferation of numan microvascular endothelial cells. PRO6071, PRO4897 and PRO6006 calcovascular endothelial cells. PRO6071, PRO4897 and PRO6006 calcovascular endothelial cells. PRO6071, PRO489, PRO5093 and PRO389, PRO6309, P ion of an s useful as a generation of les. PRO and ines. The oligonucleotide probes are useful for isolating genomic and cDNN nucleotide sequences, for measuring or detecting the expression associated gene, and as antisense probes. PRO nucleic acid is use hybridisation probe, in chromosome and gene mapping, in the gene antisense RNA and DNA, and for the preparation PRO polypeptides PRO nucleic acid are useful as therapeutic agents, e.g. vaccines o PRO polypepi genomic and cl encodes a PRO protein present sequence

The invention relates to an isolated secreted/transmembrane (PRO)

polypeptide, having at least 80% sequence identity to a sequence selected
from any one of the 57 amino acid sequences given in specification, or to
a sequence encoded by a mucleic acid molecule selected from any one of
the nucleic acids deposited under any of the ATCC accession numbers given
the nucleic acids deposited under any of the ATCC accession numbers given
the nucleic acids deposited signal peptide, an extracellular domain of PRO
lacking its associated signal peptide, Also included are vectors,
with or without its associated signal peptide, the nucleic acids encoding
transformed host cells, anti-PRO antibodies, the nucleic acids encoding
transformed host cells, inducing endothelial cell tube formation (by
administering PRO281, PRO1560, PRO189, PRO4499, PRO6308, PRO6000,
PRO10275, PRO21207, PRO20933 or PRO34274 polypeptide or its agonist) and
an oligonucleotide probe derived from any one of the above nucleotide
sequences. PRO6018 polypeptide is useful for stimulating the
proliferation or differentiation of chondrocyte cells. PRO1313, PRO20080

and PRO21383 polypeptides are useful for stimulating the proliferation of human microvascular endothelial cells. PRO6071, PRO4487 and PRO6006

polypeptides are useful for inhibiting the proliferation of human microvascular endothelial cells. PRO polypeptides are useful for detecting the presence of tumour in a mammal, including tumours of lung, colon, breast, prostate, rectal, kidney and liver. PRO281, PRO1560, PRO189, PRO6499, PRO6308, PRO6000, PRO10275, PRO21207, PRO20933 and PRO189, PRO4499, PRO6308, PRO6000, PRO10275, PRO21207, PRO20933 and PRO34274 polypeptides are useful for inducing endothelial cell tube commation. PRO or the antibody are useful in the preparation of a medicament for treating a condition responsive to PRO polypeptide. The oligonucleotide probes are useful for isolating genomic and cDNA collectide sequences, for measuring or detecting the expression of a sesociated gene, and as antisense probes. PRO nucleic acid is useful as a hybridisation probe, in chromosome and gene mapping, in the generation of an antisense RNA and DNA, and for the preparation PRO polypeptides. PRO and PRO nucleic acid are useful as therapeutic agents, e.g. vaccines. The present sequence encodes a PRO protein.

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TMF-alpha) from human blood, a method for stimulating the proliferation of dhondrocyte cells and a method for detecting the presence of a tumour in a mammal (e.g. lung, colon, breast, prostate, rectal, kidney and liver tumours). The polynucleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and DNA and in gene therapy. The polynucleotides may also be used in preparing PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of therapeutically useful reagents. The PRO polypeptides or antibodies are used in preparing a medicament for treating a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of human accountion. This sequence represents a human PRO polynucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1174
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1054
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1114

the condition responsive vaccines. e.g. PRO281 treating a coagents e.g. Novel isolated PRO polypeptides preparation of a medicament for polypeptide, and as therapeutic WPI; 2003-625485/59 P-PSDB; ADA01034.

English Claim 2; Fig 9; 307pp; The invention relates to an isolated secreted/transmembrane (PRO)

polypeptide, having at least 80% sequence identity to a sequence selected from any one of the 57 amino acid sequences given in specification, or to sequence encoded by a mucleic acid molecule selected from any one of in specification, or a sequence having at least 80% identity to PRO in specification, or a sequence having at least 80% identity to PRO lacking its associated signal peptide. Also included are vectors, transformed host cells, anti-PRO antibodies, the nucleic acids encoding PRO, PRO fusion proteins, inducing endothelial cell tube formation (by administering PRO281, PRO1560, PRO189, PRO499, PRO6309, PRO6000, administering PRO281, PRO1560, PRO189, PRO4499, PRO6309, PRO6000, PRO1801383 polypeptide or its agonist) and an oligonucleotide probe derived from any one of the above nucleotide sequences. PRO6018 polypeptide is useful for stimulating the pro118 PRO1313, PRO20080 and PRO51383 polypeptides are useful for stimulating the pro118 pro6006 bull microvascular endothelial cells. PRO polypeptides are useful for inhibiting the pro116 are useful for inhibiting the pro116 pro2003 and pro189, PRO4499, PRO6400, PRO10275, PRO20193 and PRO189, PRO4499, PRO6000, PRO1187, PRO20933 and PRO381474 polypeptides are useful for inducing endothelial cells to prostate, rectal, kidney and liver. PRO2033 and PRO39174 polypeptides are useful for inducing endothelial cell tube formation of a

                                                                                                                                                                                                                                                                                                                                 1354
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1654
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1594
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1834
medicament for treating a condition responsive to PRO polypeptide. The oligonucleotide probes are useful for isolating genomic and cDNA nucleotide sequences, for measuring or detecting the expression of an associated gene, and as antisense probes. PRO nucleic acid is useful as a hybridisation probe, in chromosome and gene mapping, in the generation of antisense RNA and DNA, and for the preparation PRO polypeptides. PRO and PRO nucleic acid are useful as therapeutic agents, e.g. vaccines. The present sequence encodes a PRO protein.
                                                                                                                                                                      128
                                                                                                                                                                                                       188
                                                                                                                                                                                                                                          248

)2008(prigg PRO e.g. gene New isolated nucleic acid encoding a PRO polypeptide, PRO21383, useful in molecular biology, chromosome and generating antisense RNA and DNA, and in gene therapy.

9; 352pp; English ሙ •ሓ ወ .; N Claim

The invention relates to an isolated secreted/transmembrane (PWU)

Completion, having at least 80% sequence sidentity to a sequence selected

Thom any one of the 57 amino acid sequences given in specification, or to
a sequence encoded by a nucleic acid molecule selected from any one of
the incleic acids deposited under any of the ATCC accession numbers given
the incleic acids deposited under any of the ATCC accession numbers given
the sequence acids deposited whing at least 80% identity to PRO
lacking its associated signal peptide. Also included are vectors,
transformed host cells, anti-PRO antibodies, the mucleic acids encoding
PRO, PRO fewion proteins, inducing endothelial cell tube formation (by
administering PRO231, PRO1806, PRO189, PRO4499, PRO6108, PRO6108,
PRO10275, PRO2107, PRO2033 or PRO34374 Polypeptide or its agonist) and
an oligomucleotide probe derived from any one of the above nucleotide
proliferation or differentiation of chondrocyte cells. PRO1313, PRO2000

RRO10313, PRO5133 polypeptide is useful for stimulating the proliferation of
microvascular endothelial cells. PRO6101, PRO4487 and PRO6006

polypeptides are useful for stimulating the proliferation of human
microvascular endothelial cells. PRO6101, PRO4487 and PRO5006

polypeptides are useful for inhibiting the proliferation of human
microvascular endothelial cells. PRO polypeptides are useful for
polypeptides are useful for inhibiting the proliferation of human
microvascular endothelial cells. PRO polypeptides are useful for
polypeptides are useful for inhibiting endothelial cell tube
formation. PRO or the antibody are useful in the preparation of
medicament for treating a condition responsive to PRO polypeptide. The
oligomucleoride probes are useful for inducing endothelial cell tube
oligomucleoride probes are useful for propes. PRO nucleic acid suseful as a
mesociated gene, and as antisense probes. PRO mucleic acid are useful a
microsiated gene, and as antisense probes. PRO mucleic acid are useful as
alsociated gene, and as antisense and g associated gene, and as antisense probes. PRO nucleic acid is hybridisation probe, in chromosome and gene mapping, in the gentisense RNA and DNA, and for the preparation PRO polypeptide PRO nucleic acid are useful as therapeutic agents, e.g. vaccin present sequence encodes a PRO protein. are user encodes

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, a method for stimulating the proliferation or differentiation of chondrocyte cells and a method for detecting the presence of a tumour in a mammal {e.g. adrenal, lung, colon, breast, prostate, rectal, cervical and liver tumours}. The polynucleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and DNA and in gene therapy. The polynucleotides may also be used in preparing PRO polypeptides by recombinant techniques and in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 useful

generating either transgenic animals or knock-out animals which are useful in the development and screening of therapeutically useful reagents. The PRO polypeptides or antibodies are used in preparing a medicament for treating a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of human microvascular endothelial cells, for inducing endothelial cell tube formation and for treating various bone and/or cartilage disorders such as sports injuries and arthritis. PRO polypeptides which stimulate the release of proteoglycans from cartilage are useful for treating sports-related joint problems, articular cartilage defects, osteoarthritis and rheumatoid arthritis. PRO polypeptides are also useful for treating various mammalian haemoglobin-associated disorders such as various thalassaemias and conditions which may benefit from enhanced local immune system cell infiltration. This sequence represents a human condition of the invention.

sapiens Ношо

The invention describes an isolated PRO (secreted and transmembrane)

polypeptide (1). RR06018 polypeptide is useful for stimulating the
proliferation or differentiation of chondrocyte cells. PRO20180,

or PR02133 polypeptide is useful for stimulating the proliferation of
human microvascular endothelial cells. PR06071, PR04487, or PR0606

polypeptide is useful for inhibiting the proliferation of human
microvascular endothelial cells. PR0 POLYpeptides such as PR0206

polypeptide is useful for inhibiting the proliferation of human
microvascular endothelial cells. PR0 POLYpeptides such as PR0206

CC PR0608, PR01002, PR041316, etc., are useful for detecting the presence of
tumour in a marmal which involves comparing the level of expression of
the above mentioned polypeptides in a test sample of cells taken from the
mammal, and a control sample of normal cells of the presence of tumour
cc omparate to the control sample is indicative of the presence of tumour in
the mammal, the tumour being adrenal tumour, cervical tumour colon tumour,
the mammal, the tumour pelng adrenal tumour, cervical tumour in liver
the mammal, the tumour pelng adrenal tumour, cervical tumour or liver
tumour. PR06018 polypeptide is useful for screening compounds to
breast tumour. PR06018 polypeptide are useful for screening compounds to
comparate the propolypeptide are useful as molecular weight markers for
protein electrophoresis. (I) is also useful for screening compounds to
identify those that mimic the PR0 polypeptide (agonists) or prevent the
condition probes for a cDN library to isolate the full length in the generate either conva. Mucleotide sequences encoding RD
conva to isolate sfull other conva interportions may be used as
hypridisation probes for a cDN library to isolate the full length in the derectopement and screening of therapeutically
cuseful reagents. (II) encoding (I) or its modified forms can also be
considered either and transmembrane properties are also useful in gene
cused to generate either transgenic enably sequence encod chondrocyte Novel isolated PRO1313, PRO20080 or PRO21383 polypeptide useful for stimulating proliferation of human microvascular endothelial cells, PRO6018 polypeptide useful for stimulating proliferation of chondrocells. Ŋ JC; Zhang molecules are useful for tissue typing. This sequence encodes human secreted and transmembrane PRO polypeptide.
